

● SteamCore

● By Woyboy

- Unity Version: Unity 6 (6000.0.45f1)
 - Facepunch Steamworks Version: 2.4.1
-

→ Features:

- + SteamIntegration.cs
- + AchievementManager.cs
- + Facepunch.Steamworks folder (Actual implementation)

→ How to Install and implement:

1. Download the package from the GitHub repo (duh!!) through a UnityPackage or the entire thing. (I recommend the UnityPackage)
2. Move the package/folders into your assets folder, if it's outside it will not work.
3. To be sure you have everything, you should have 3 folders containing Plugins, Prefabs, and Scripts
4. In the Prefabs folder drag and drop the "[++ Steam Integration](#)" GameObject into your scene.
5. Go to the scripts folder and open the [SteamIntegration.cs](#) file
6. In the [Start\(\)](#) method insert your App ID inside this line of code:
`Steamworks.SteamClient.Init(0000000)`, very important
7. You're done!

→ Other Features of SteamIntegration.cs:

- + There are 2 simple methods you can use in this script, but this script should mainly just handle the simple integration of Steamworks in your app
- + [GetSteamName\(\)](#) => returns the Steam name (not username)
- + [GetPlayerSteamID\(\)](#) => returns the Steam player's ID (ex: STEAM_0:1:12345678)

→ How to unlock/clear/check achievements:

1. Both scripts follow a singleton pattern and has a static instance to easily access
2. Inside the [AchievementManager.cs](#) file is a static class called AchievementIDs. I recommend using it to keep an organized list of all your achievements and their IDs.
3. Lastly call on [AchievementManager.cs](#) with the public methods such as
 - a. `UnlockAchievement(string achievementId)`
 - b. `ClearAchievement((string achievementId)`
 - c. `AchievementStatus((string achievementId)`
